

## ASIA-PACIFIC REGIONAL SNAPSHOT 2024

**32** out of 36 countries in the UNFPA Asia-Pacific region have completed at least one violence against women (VAW) prevalence survey

**12** countries have comparable data to monitor change over time

**27** countries have data on physical, sexual and emotional partner violence in the last 12 months for SDG indicator 5.2.1.

**20** countries have data on sexual violence in the last 12 months for SDG indicator 5.2.2.

**25** countries have conducted at least one dedicated survey on the prevalence of violence against women since 2000, using or adapting the WHO methodology

**17** countries have their latest data produced by a dedicated survey

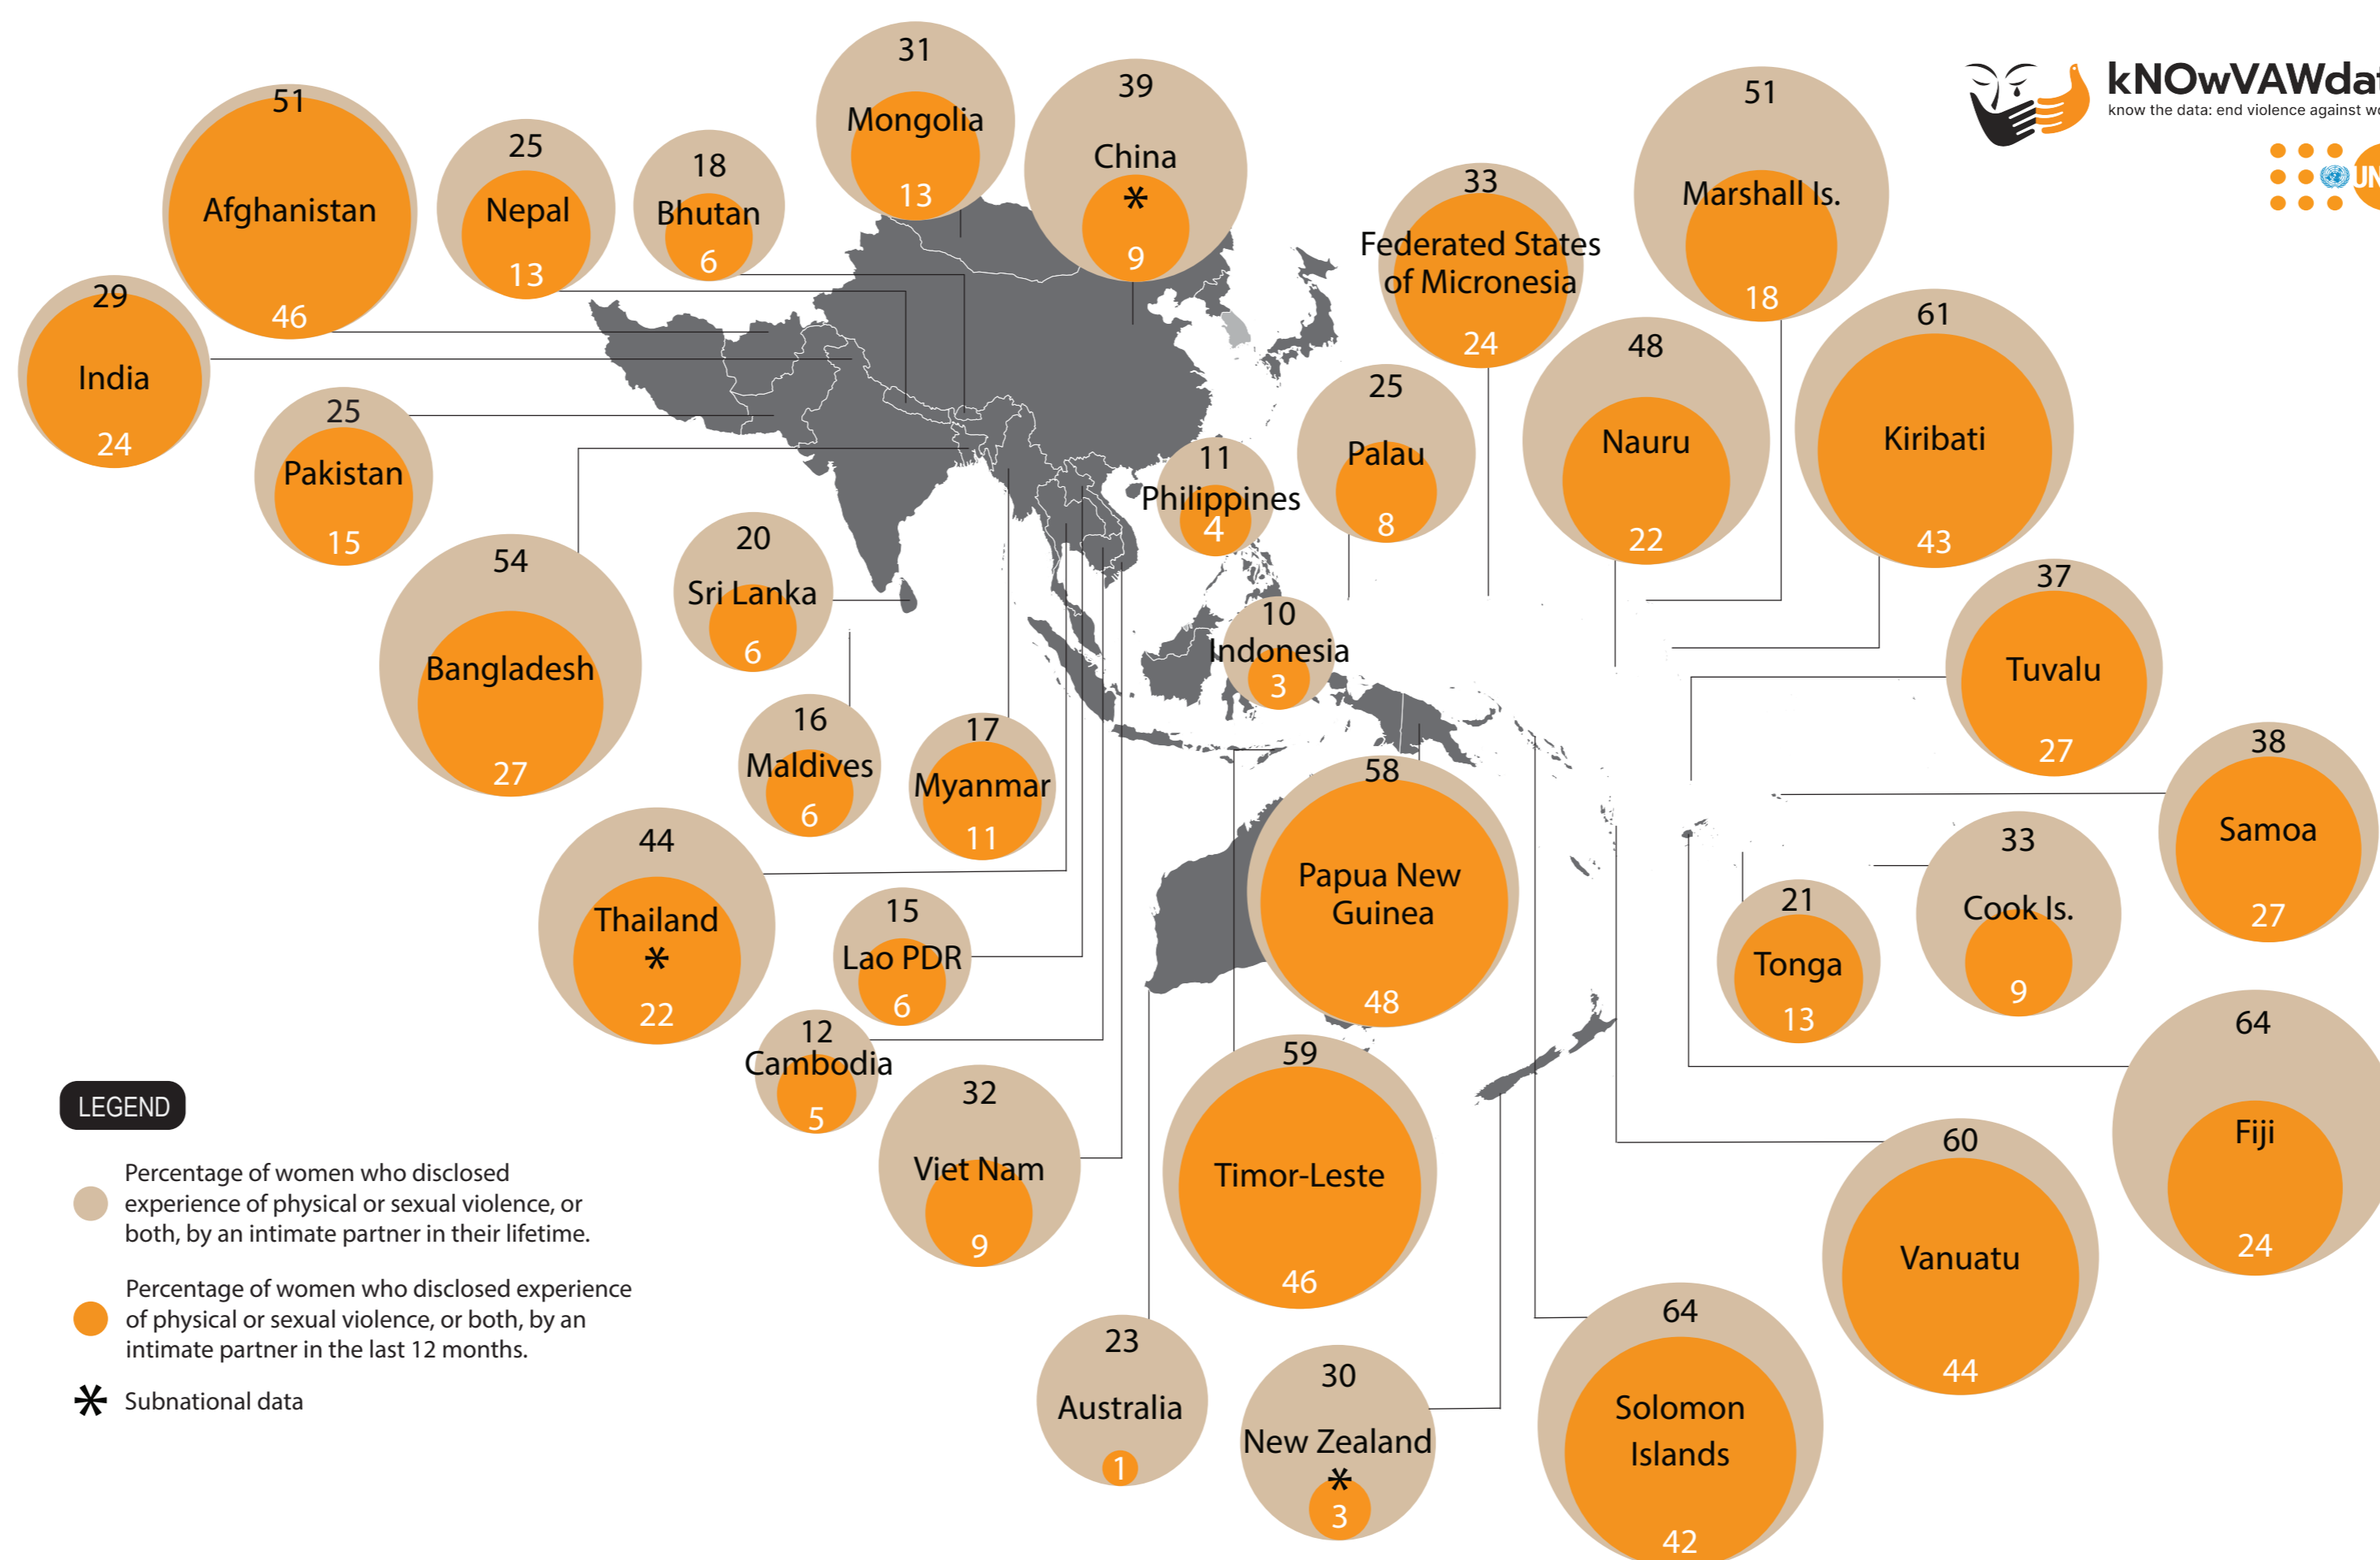

**Dedicating a survey** to violence against women allows for a strong focus on safety and ethics, comprehensive interviewer training and more questions about violence and the context in which it occurs. This supports in-depth analysis and typically provides more accurate estimates. However, no matter what the approach, surveys can never capture the full extent of violence because some women are not represented and some will not disclose their experience. While surveys are the only way to measure the magnitude of violence, the results will always be an underestimate.

### Key Findings

By country, the proportion of women who have reported experience of physical or sexual violence by an intimate partner in their lifetime ranges from 10 percent in Indonesia to 64 percent in Fiji and Solomon Islands. The evidence shows that many women have told no one about their experience, not even a friend or someone they trust. This shows how critical these national prevalence surveys are to shed light on this issue and give survivors of violence a voice.

The proportion of women who have reported experience of physical or sexual violence by an intimate partner in the past 12 months ranges from 3 percent in Indonesia to 48 percent in Papua New Guinea.

In most countries of the region, women are much more likely to have experienced intimate partner violence than to have experienced physical or sexual violence by someone other than a partner. Cook Islands and Samoa differ from other countries in that women are more likely to have experienced physical violence by perpetrators other than partners, such as by family members or teachers.

### LEGEND

Percentage of women who disclosed experience of physical or sexual violence, or both, by an intimate partner in their lifetime.

Percentage of women who disclosed experience of physical or sexual violence, or both, by an intimate partner in the last 12 months.

\* Subnational data

**General notes on map and tables**

This snapshot presents data from countries where UNFPA has an operational presence, alongside Australia and New Zealand, reflecting a broader regional context and partnerships in addressing violence against women and girls. The data presented in Table 2 is the most comparable available, but it should not be directly compared without considering several important factors:

- Variation in Questionnaires:** Different questionnaires can yield different results due to variations in wording, structure, and the focus of the questions.
- Differences in violence definitions:** Definitions of key concepts, such as emotional violence or controlling behaviors, can vary significantly between countries, affecting how these issues are measured.
- Variation in partner definition:** The type of partners included in the studies may differ—some countries or methodologies focus only on the most recent partner, while others may focus exclusively on husbands.
- Differences in scope:** Rates of help-seeking or violence during pregnancy may relate only to intimate partner violence (IPV), while others include violence by any perpetrators.

This 2024 snapshot is the eighth annual edition of this publication. The data in the map and Table 2 reflect the most recent data collected with, in most cases, the WHO methodology, the DHS or MICS domestic violence module. The data in this publication are sourced from publicly available survey reports, as of December 2024. For Indonesia, data are based on preliminary results of the 2024 national study, unless otherwise indicated. For Thailand, the prevalence rates are calculated as average for the two sites.

**n.a.:** data not collected, not available in source report, or not comparable.  
**Three periods ( ... )** indicate no known survey conducted or no results available yet.  
**'Last 12 months'** indicates the 12 month period prior to the survey interview.  
**'Lifetime'** indicates whether violence ever occurred at some point during an interviewee's life.  
**Never told anyone:** Among ever-partnered women who experienced physical or sexual intimate partner violence.  
**Violence during pregnancy:** Among ever-partnered and ever-pregnant women.  
**Attitudes to wife-beating** are measured by asking interviewees whether they believe a husband is justified in hitting or beating his wife for various reasons, such as not completing household chores or refusing sex.  
**Washington Group questions:** A set of questions designed to identify people with disabilities based on their difficulties in functioning in six key areas: seeing, hearing, walking or climbing steps, remembering or concentrating, self-care, and communication. These questions can provide a basis for disaggregating data by disability status.

Violence measurement varies; these are common examples of measured behavioral acts:  
**Emotional abuse:** humiliating, belittling or threats to harm her or others she cares about.  
**Physical violence:** slapping, pushing, shoving, biting, hair-pulling, kicking, throwing things, choking, burning, threatening or using a weapon.  
**Sexual violence:** forced/coerced intercourse or attempts to do so and unwanted touching.  
**Economic abuse:** denying a woman access to work, control over her earnings or access to money for household expenses.  
**Controlling behaviours:** preventing a woman from seeing her friends or family, insisting on knowing where she is at all times or insisting that she asks permission to seek health-care. Both emotional abuse and controlling behaviours are sometimes referred to as psychological violence.
